

Software Testing & Maintenance[1] (5) quality =

- * It is the degree of conformance of a (S) to its functional & non-functional req. & expectations.
- * It is a complex & multi-layered concept that must be described from 5 points.

- 1) Excellence view
- 2) User view
- 3) Manufacturing "
- 4) Product "
- 5) Value-based "

* Factors of (S) quality are -

1) Efficiency :

The ability of (S) to perform well / achieve a result without wasted energy, resource, effort, time.

2) Flexibility :

Effort required to modify an op's system

3) Extendability :

Ability of (S) to carry out the (S) as designed.

4) Portability :

Ability of (S) to be transferred easily from 1 location to another.

5) Testability :

Ability of (S) to be easily tested.

6) Usability :

Degree of (S)'s ease of use.

[2] (5) quality Dilemma :

* If you produce a (S) system that has bad quality, you lose bcz no 1 will want to buy it.

* Any time (S) and business come together there is an inherent conflict b/w

'get it done fast' & 'do a gd job'.

* The dilemma (trade-off) quality, speed & feature set is the dilemma in (S).

(eg 3-4 min from achieve a desired

goal & 2 more achieve a desired goal)

* Any (S) project has 3 core elements:

the speed at which the (S) ships, the fidelity of feature set & the quality of the underlying code base

* The Δ makes clear that as you move towards 1 goal, you tend to move away from others -

I Speed Dilemma:

1 of the most common things that developers hear from upper management is 'we need to ship, & we need to ship now'.

II Features Dilemma:

multi-billion dollar companies have shipped with incomplete feature sets only to make modest improvements later on.

III Quality Dilemma:

(5) engineers should make every effort to produce high-quality systems. But undue (excessive) emphasis on code quality can kill the

~~Reduce the~~ cost of quality \rightarrow cost of conformance
is \div into \rightarrow cost of non-conformance

\rightarrow BPR [Business process re-eng]:

* It is the analysis & redesign of core business processes to achieve the substantial improvements in its performance, productivity & quality.

* Need of BPR -

- a) promotes quality.
- b) increased efficiency
- c) better results & products
- d) cost & time reduction.

[3] Achieving (5) quality =

* (5) quality is the result of good project management & solid (8) eng practice.

- * (5) eng methods
 - 1) project management techniques
 - 2) quality control action
 - 3) quality assurance
 - 4) (8) quality assurance
- } h/p a (5) team to achieve high (5) quality.

I (S) engineering methods:

1st step is to build high-quality (S) & to understand the probm to be solved.

II project Management Techniques:

Help the project manager to

- * use estimation to verify that delivery dates are achievable.

- * conduct risk planning to avoid any chaos.

III Quality control:

provides monitoring the (S) development process to ensure that quality assurance procedures & standards are being followed.

IV Quality Assurance of (S) (SQA):

It is a set of activities for ensuring quality in (S) eng process

Ensures that developed (S) meets & complies with the defined quality specifications.

SQA is an ongoing process within the (S) development life cycle.

[4]

Testing =

- * process of executing a program to find errors.

- * To make our (S) perform well it should be error-free.

- * If testing is done successfully it will remove all the errors from the (S).

- * principles of Testing:

→ All the tests should meet the cust req.
→ To make our (S) testing should be performed by a third party.
→ All the tests to be conducted should be planned bfr implementing it.

- * Testing is classified into 3 categories—
1) Functional (F) → unit (U), Integration (I), smoke, V&V, Localization, etc.

- 2) Non Functional (N) → performance, load, endurance, scalability, usability, etc.

- 3) maintenance → regression, maintenance

→ Black-box (B)

- * It is carried out to test functionality of the program.

White-box (W)

It is conducted to test program & its implementⁿ, in order to improve code efficiency

* Also → Behavioral (T),
The tester in this case has a set of I/P values & respective desired results.

Also → Structural (T).
Here, design & structure of the code are known to the tester.

→ Strategic approach to (S) testing:

- * A test strategy is an outline that describes the testing approach of (S) development cycle.
 - * All testing strategies have following characteristics:
 - * Before testing with testing, effective technical reviews must be conducted to eliminate obvious errors.
 - * Testing proceeds in an outward manner.
- Different types of (S) (T) strategies —
- 1) Model based T.S
 - 2) Methodical T.S
 - 3) Analytic T.S
 - 4) Reactive T.S
 - 5) Consultative T.S.

→ Strategic issues:

- * Specify product req. in a quantifiable manner (req bfr (T)).
- * State (T) objectives explicitly.
- * Develop a continuous improvement approach for the (T) process.

[S] → Levels of (T) =

I Unit (T):

- * type of (S) (T) where individual components of a (S) are tested.
- * program is to validate each unit of (S) performs as designed
- * (T) is performed under white-box (T) approach

II Integration (T):

- * type of (T) where (S) modules are integrated logically & tested as a grp.
- * conducted to evaluate the compliance of a system with (T) req.

Acceptance (U)

III. System (T) :

- * It is a black box (T)
- * technique conducted on a complete integrated system to evaluate the system's compliance with req. req.
- * Purpose of S.T. is to detect any interdependencies b/w the units that are integrated together.
- * There are 50+ types of S.T., some are -
 - 1) Validity (T)
 - 2) Load (T)
 - 3) Regression (T)
 - 4) Recovery (T)
 - 5) Functionality (T)
 - 6) Security (T) ~

IV. Validation (T) :

- * Process of checking that a (S) system meets specification & that is building its intended purpose
- * (S) verification:
 - process of evaluating (S) to determine whether the products of a given development phase satisfy the conditions
 - * The aim of (S) verification is to check that the (S) meets its stated functional & non-functional req.
 - * "validation" is essential, b/c req. specific" doesn't always reflect the need of system user & users.

V

Alpha (T) :

- * conducted in the organization & tested

VI. Beta (T) :

- After (S) is tested internally, it is

[6]

Software Maintenance =

- * once the (S) is delivered & deployed,

→ Art of Debugging =

- * It is systematic process of identifying, analysing & fixing bugs in the (S).
- * occurs as a consequence of successful testing.
- * considered necessary in most of the newly developed (S).

VII. Regression (T) :

- * whenever a (S) product is updated with new code, feature / functionality, it is tested thoroughly to detect if there is any -ve impact of the added code.

by a representative grp of end-users at the developer's side.

handed over to the users to use it under their production environment only for (T) purpose.

(m) → maintenance

it enters the (m) phase.

- * It is the process of modifying a (S) product after it has been delivered to the user to fix faults to improve performance.

* 4 types of (m) activities —

(1) Corrective (m): (2) Adaptive (m):

- * It is concerned with fixing errors that arise to changes in the observed when (S) is in environment like hardware or OS.

- * It deals with the repair of defects found in day-to-day system (S) act on the system.

(3) Perfective (m):

- * Mainly deals with implementing new/changed user req.
- * Involves making (1)-(2) enhancements to the system to use system's performance

(4) Preventive (m):

- * Involves performing activities to prevent the occurrence of errors. It comprises document updating code optimization & code restructuring.

→ (5) Supportability:

capability of supporting a (S) system over its whole product life. covers the whole life cycle once it enters into service.

[7] Reengineering =

Appln of technology & management science to the modification of existing system, processes in order to make them more responsive.

* Relates to —

(a) BPR: [Business process reeng]

- * It is the analysis & redesign of core business processes to achieve the substantial improvements in its performance, productivity & quality.

* Need of BPR:

- * Promotes quality
- * Cost & time reduction
- * Need efficiency.

* A BPR model —

There is no start & end to BPR — it is evolutionary process.

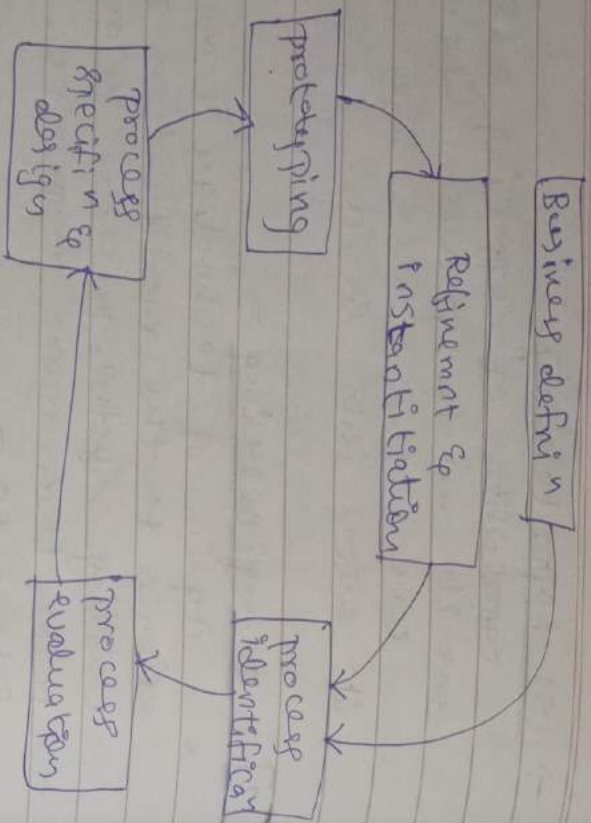

fig: A BR model.

(b) Strengthening:

- * It is the examination, analysis & alteration of an existing (S) system mostly used in the context where a legacy system is involved
- * General reeng objectives—
- 1) preparation for total enhancement
- 2) improve maintainability
- 3) migration
- 4) improve reliability.

conceptual design → Starting phase in the process of planning.

fig: forward model for (S) eng.

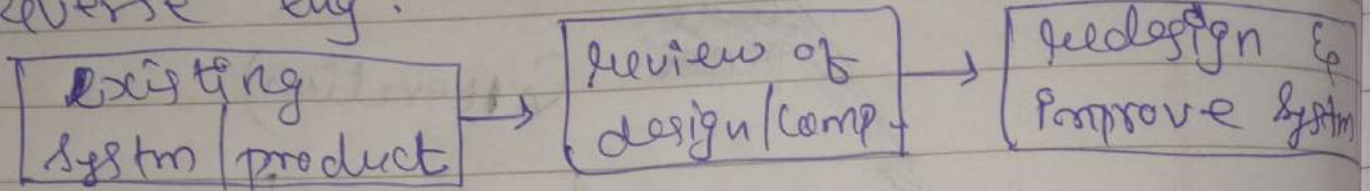

⇒ Forward eng:

- * Applis are developed with gun req.
- * Takes more time for development
- * production is started with gun req
- * requires high proficiency skills

Reverse eng:

- * info for the system are collected from the gun applis
- * takes less time for development.
- * production is started by taking existing product
- * not require

Reverse eng :
